ACKNOWLEDGEMENT

We would like to express our deepest appreciation to all those who provided us the possibility to complete this Mini Project report. A special gratitude we give to our Third Year Mini Project mentor, **Prof. Shweta Junghare,** whose contribution in stimulating suggestions and encouragement helped us to coordinate our project. He gave us support from the start to the end of this mini project and kept us on the correct path.

We would like to express my special thanks to **Prof. Vivek Shelke**, Mini Project In- Charge of Computer Engineering and **Prof. C. V. Andhare, Head of the Department, Computer Engineering, Government College of Engineering, Yavatmal** who have invested their full efforts in guiding the team in achieving the goal for all the timely support and valuable suggestions during the period of project.

We would like to express our sincere thanks to **Dr. V. B. Waghmare, Principal of Government College of Engineering Yavatmal**, for providing the Working facilitiesin college.

We are equally thankful to all the staff members of Computer Engineering Department, Government College of Engineering, Yavatmal for their valuable suggestions. Also, we would like to thank all of my friends for the continual encouragement and the positive support.

Abstract

The demand for innovative and efficient interactive tools is growing rapidly in today's digital landscape. Traditional whiteboards, while effective in certain scenarios, are limited by physical space and accessibility, and are not well-suited for remote collaboration. This project introduces "CanvasCraft - ML Powered Digital Board," an advanced desktop application leveraging the MediaPipe library to detect hand movements and create a virtual canvas that users can interact with using a virtual pointer.

CanvasCraft employs cutting-edge machine learning technology to offer a seamless, hands-free drawing and writing experience, making it an ideal tool for both educational and professional settings. Running locally on a user's device, CanvasCraft ensures responsiveness and reliability without relying on internet connectivity. The application demonstrates the potential of AI and machine learning to enhance digital collaboration tools, providing users with an intuitive and innovative solution.

This paper reviews the implementation and benefits of using AI-powered hand tracking for interactive desktop applications and discusses the integration of various technologies that make CanvasCraft a robust and user-friendly platform. The primary aim of this project is to showcase the potential of AI in creating efficient digital whiteboard solutions, thereby inspiring further innovation in the realm of digital interactive tools.

Keywords: MediaPipe, AI, desktop application, digital whiteboard, hand tracking, virtual pointer, scalability, cost-effectiveness, interactive applications, machine learning.

Chapter 1: INTRODUCTION

1.1 Introduction

Overview

CanvasCraft is a pioneering project aimed at revolutionizing the way we interact with digital whiteboards by employing artificial intelligence (AI) and computer vision technologies. The core objective is to create a seamless and intuitive virtual whiteboard that users can control with hand gestures, without the need for physical touch or traditional input devices. By utilizing the MediaPipe library for hand movement detection and OpenCV for image processing, CanvasCraft offers a dynamic and engaging drawing experience that mirrors the natural act of writing or drawing on a physical whiteboard.

Motivation

The motivation behind CanvasCraft stems from the increasing need for interactive and touchless interfaces, particularly in the context of remote learning, virtual meetings, and digital collaboration. Traditional whiteboards and drawing tools, while effective, have limitations in terms of accessibility and convenience. Touch-based devices, although popular, can pose hygiene concerns in shared environments. Furthermore, the rise of virtual and augmented reality applications has highlighted the potential of gesture-based controls as a more natural and immersive method of interaction.

CanvasCraft addresses these challenges by providing a touchless interface that can be used in various settings, from classrooms to corporate offices, and even in creative industries where artists and designers can benefit from a more fluid and intuitive drawing tool.

Objectives

The primary objectives of the CanvasCraft project are:

1. **Hand Movement Detection**: Leverage the capabilities of the MediaPipe library to accurately detect and track hand movements in real-time.
2. **Virtual Drawing Interface**: Develop a virtual whiteboard where users can draw using hand gestures as a virtual pointer, mimicking the experience of drawing on a physical surface.
3. **User-Friendly Interaction:** Design an intuitive user interface that allows users to easily switch between different modes (e.g., drawing, selecting) and tools (e.g., different brush colors, eraser).
4. **Customization Options**: Provide users with the ability to customize their drawing experience, including selecting different brush sizes and colors, and using an eraser to correct mistakes.

5. **Real-Time Performance:** Ensure that the system operates with minimal latency to provide a smooth and responsive user experience, critical for maintaining the natural feel of drawing.

Technological Background

CanvasCraft is built on two primary technological pillars: MediaPipe and OpenCV.

- **MediaPipe**: An open-source framework developed by Google, MediaPipe is designed for building multimodal applied machine learning pipelines. It includes robust models for hand tracking, which detect and track the positions of 21 hand landmarks in real-time. This functionality is crucial for interpreting hand gestures and translating them into drawing commands.
- **OpenCV**: OpenCV (Open-Source Computer Vision Library) is a highly optimized library for real-time computer vision. It provides tools for image and video processing, which are essential for capturing the live video feed from a webcam, detecting hand positions, and rendering the virtual drawing on the canvas.

Use Cases and Applications

CanvasCraft has a wide range of potential applications across different fields:

1. **Education**: In classrooms, teachers can use CanvasCraft to annotate and illustrate lessons without needing to touch a screen or whiteboard, making it hygienic and interactive.
2. **Corporate Meetings**: During virtual meetings, presenters can use CanvasCraft to highlight key points and brainstorm ideas visually, enhancing engagement and clarity.
3. **Creative Industries:** Artists and designers can benefit from the fluidity and responsiveness of CanvasCraft, allowing for more expressive and dynamic digital art creation.
4. **Accessibility:** Individuals with disabilities that limit their use of traditional input devices can use hand gestures to interact with digital content, promoting inclusivity.

1.2 Problem definition

Traditional whiteboards are essential for teaching and collaboration but face limitations like physical markers, limited space, and difficulty in saving content. The shift to remote learning and virtual meetings has highlighted the need for digital whiteboards that replicate the interactivity of physical ones. Existing digital solutions are often costly, require specialized hardware, or lack intuitive interfaces, and few offer hands-free interaction.

"CanvasCraft - AI Powered Whiteboard" aims to address these issues by using the MediaPipe library for hand movement detection, allowing users to draw and write on a digital canvas using hand gestures. This project seeks to provide an accessible, cost-effective, and intuitive digital whiteboard solution for both remote and in-person use.

Chapter 2: CONCEPT DEFINITION AND SCOPE

2.1 Concept Statement

CanvasCraft is an innovative AI-powered virtual whiteboard designed to facilitate touchless interaction through hand gesture recognition. The core idea is to leverage computer vision and machine learning technologies to detect and interpret hand movements, translating them into drawing actions on a digital canvas. This approach aims to provide a natural and intuitive drawing experience, replicating the ease and fluidity of writing or drawing on a physical whiteboard, but with the added convenience and versatility of digital tools.

2.2 Scope of study

The scope of the CanvasCraft project encompasses several key areas:

1. **Hand Gesture Recognition**: Research and development of robust methods for detecting and tracking hand movements using computer vision techniques.
2. **Virtual Drawing Interface**: Creation of a digital canvas where users can draw, erase, and select tools using hand gestures.
3. **Real-Time Performance**: Ensuring that all interactions are processed in real-time, providing immediate feedback to the user.
4. **User Experience Design**: Developing an intuitive and user-friendly interface that simplifies interaction and enhances usability.
5. **Application Domains**: Exploration of potential applications in various fields, including education, corporate environments, and creative industries.
6. **Customization and Extensibility**: Designing the system to allow for future enhancements, including additional gestures, tools, and multi-user capabilities.

2.3 Technologies used

CanvasCraft leverages several advanced technologies to achieve its goal of providing a seamless, intuitive, and responsive virtual whiteboard experience. Here is a detailed description of the key technologies used:

1. MediaPipe

MediaPipe is an open-source framework developed by Google for building multimodal applied machine learning pipelines. It is designed to handle various data streams such as video, audio, and sensor data, and it provides efficient solutions for real-time processing. In the context of CanvasCraft, MediaPipe is used specifically for its hand tracking capabilities.

- **Hand Tracking**: MediaPipe's hand tracking solution can detect and track the positions of 21 hand landmarks per hand in real-time. This includes key points on the fingers and palm, allowing the system to interpret complex hand gestures accurately.

- **Real-Time Performance**: MediaPipe is optimized for real-time performance, ensuring that hand detection and tracking occur with minimal latency, which is crucial for maintaining a smooth and responsive user experience.

- **Cross-Platform Support**: MediaPipe can run on multiple platforms, including mobile and web, making it a versatile choice for developing interactive applications.

2. OpenCV

OpenCV (Open Source Computer Vision Library) is a highly optimized library used for real-time image and video processing. It provides a wide range of tools for computer vision tasks, making it an essential component of the CanvasCraft system.

- **Video Capture and Processing**: OpenCV is used to capture the live video feed from the webcam and process each frame to detect and track hand movements. It supports various image processing techniques, such as filtering, thresholding, and morphological operations, which are used to enhance the quality of the captured images.

- **Drawing and Rendering**: OpenCV provides functions for drawing shapes, lines, and text on images, which are utilized to render the virtual drawing on the canvas. This includes functions like cv2.line for drawing lines and cv2.circle for drawing points.

- **Integration with Other Libraries**: OpenCV seamlessly integrates with other libraries such as NumPy, allowing efficient handling of image data and manipulation of arrays.

3. NumPy

NumPy is a fundamental package for scientific computing in Python. It provides support for large, multi-dimensional arrays and matrices, along with a collection of mathematical functions to operate on these arrays. In CanvasCraft, NumPy is used primarily for handling and processing image data.

- **Array Manipulation**: NumPy allows efficient manipulation of image arrays, including operations

like resizing, reshaping, and converting between different data types.

- **Image Processing**: NumPy is used in conjunction with OpenCV to perform various image processing tasks, such as converting images to grayscale, applying binary thresholding, and creating masks for blending images.

- **Performance**: NumPy is optimized for performance, ensuring that image processing operations are performed quickly and efficiently, which is crucial for maintaining real-time performance in CanvasCraft.

4. Python

Python is the primary programming language used for developing CanvasCraft. It is chosen for its simplicity, readability, and extensive library support for AI and computer vision tasks.

- **Ease of Use**: Python's simple and readable syntax makes it easy to write and maintain code, which is important for rapid development and iteration.

- **Extensive Libraries**: Python has a rich ecosystem of libraries for machine learning, computer vision, and numerical computing, including MediaPipe, OpenCV, and NumPy. This allows developers to leverage pre-built functions and models, reducing the need for developing everything from scratch.

- **Community Support**: Python has a large and active community, providing access to a wealth of resources, tutorials, and documentation, which can be invaluable for troubleshooting and learning.

2. 4 Functional Requirements (Detailed)

1. Hand Detection

- **Accuracy**: The system should detect and track hand movements accurately using the webcam. MediaPipe's hand tracking model is employed to ensure precision in detecting hand landmarks.
- **Real-Time Processing**: The detection process must be real-time, meaning the system should process each frame from the video feed quickly enough to provide immediate feedback to the user.

2. Gesture Interpretation

- Recognition: The system should distinguish between different gestures, such as drawing (index finger up) and selection mode (index and middle fingers up). MediaPipe provides the necessary data points to determine the position and status of each finger.
- Action Mapping: Each recognized gesture should be mapped to a specific action, such as drawing a line, selecting a tool, or activating the eraser.

3. Drawing Capabilities

- Virtual Canvas: A digital canvas where users can draw using hand gestures. This involves rendering lines and shapes based on the tracked hand movements.
- Customization: Users should be able to select different brush sizes and colors to customize their drawing experience. The system should provide a user-friendly interface for making these selections.

4. Eraser Functionality

- Activation: The system should allow users to switch to an eraser tool using a specific gesture. Once activated, the eraser should remove parts of the drawing on the canvas.
- Adjustable Size: The eraser should have adjustable thickness, similar to the brush tool, to accommodate different erasing needs.

5. Tool Selection

- Interface: A simple and intuitive interface for selecting different drawing tools and colors. This could be implemented using overlay images that users can click on with gestures to change tools.
- Feedback: Visual feedback to indicate the currently selected tool and color, ensuring users are aware of their current settings.

6. Real-Time Processing

- Minimal Latency: All hand detection, gesture recognition, and drawing actions should be processed in real-time, with minimal latency to ensure a natural and responsive experience.
- Performance Optimization: The system should be optimized to handle the computational load efficiently, making use of hardware acceleration where possible.

Summary

By integrating MediaPipe for precise hand tracking, OpenCV for image processing and rendering, NumPy for efficient data handling, and Python for overall application development, CanvasCraft achieves its goal of creating an AI-powered virtual whiteboard that is both powerful and user-friendly. These technologies work together to provide a seamless and intuitive drawing experience, leveraging advanced AI and computer vision techniques to interpret hand gestures and translate them into real-time actions on a digital canvas.

Chapter 3: IMPLEMENTATION

The implementation of CanvasCraft involves several key components and steps to develop an AI-powered virtual whiteboard. The project leverages computer vision and machine learning libraries such as OpenCV and MediaPipe to detect hand movements and translate them into drawing actions on a digital canvas. This chapter provides a detailed description of the tools, system architecture, process flow, and key functions involved in the implementation.

Tools and Libraries

1. **OpenCV**: OpenCV (Open-Source Computer Vision Library) is a powerful library for real-time computer vision. It provides tools for image and video processing, which are essential for capturing and processing the live video feed from a webcam. OpenCV is used to handle image manipulation, drawing operations, and integrating the virtual whiteboard interface.

2. **MediaPipe**: MediaPipe, developed by Google, is an open-source framework for building multimodal machine learning pipelines. It includes robust models for hand tracking, capable of detecting and tracking 21 hand landmarks in real-time. MediaPipe is crucial for interpreting hand gestures and converting them into drawing commands.

3. **NumPy**: NumPy is a fundamental package for scientific computing in Python. It is used for handling arrays and performing mathematical operations on image data, which is necessary for image processing tasks.

System Architecture

The system architecture of CanvasCraft is designed to integrate video capture, hand detection, gesture recognition, and drawing functionalities into a cohesive application. The main components of the architecture include:

1. **Video Capture**: Captures the live video feed from a webcam.
2. **Hand Detection**: Uses MediaPipe to detect hands and track finger positions in real-time.
3. **Gesture Recognition**: Interprets the detected hand landmarks to recognize specific gestures for drawing, selecting tools, and erasing.
4. **Drawing Logic**: Executes drawing operations on a virtual canvas based on the recognized gestures.
5. **Overlay Management**: Manages different overlays for color selection and eraser functionality.

6. **User Interface**: Displays the video feed with the drawn content and interaction overlays.

Process Flow

The implementation of CanvasCraft follows a structured process flow to ensure seamless and responsive interaction:

1. **Initialization**: The system initializes the webcam and sets the video capture parameters. This step involves configuring the video resolution and preparing the capture device for real-time processing.

2. **Hand Detection**: The live video feed from the webcam is processed using MediaPipe to detect hands and identify the positions of 21 hand landmarks. The hand detection model runs continuously to track hand movements in real-time.

3. **Gesture Recognition**: The detected hand landmarks are analyzed to recognize specific gestures. For instance, the system distinguishes between selection mode (two fingers up) and drawing mode (index finger up). The gestures are interpreted to determine the appropriate drawing actions.

4. **Drawing Execution**: Based on the recognized gestures, the system updates the virtual canvas. If the user is in drawing mode, the system draws lines on the canvas following the movement of the index finger. If the user switches to eraser mode, the system erases the specified areas on the canvas.

5. **Overlay Display**: The system manages and displays tool selection overlays, allowing users to switch between different drawing tools and colors. The overlays provide a visual interface for users to interact with the virtual whiteboard.

Key Functions

1. **findHands()** : This function detects hands in the video feed and draws landmarks on the image. It converts the image to RGB format, processes it with MediaPipe to detect hand landmarks, and draws the landmarks on the original image if specified.

2. **findPosition()** : This function retrieves the positions of the detected hand landmarks. It iterates through the landmarks, calculates their coordinates, and returns a list of landmark positions. This list is used to determine hand gestures and drawing actions.

3. **fingersUp()** : This function determines which fingers are up based on the positions of the landmarks. It checks the relative positions of the fingertips and the lower joints to identify if a finger is extended or folded. The result is a list indicating the status of each finger (up or down).

4. **Drawing Logic** : The drawing logic interprets the positions of the index finger to perform drawing operations on the virtual canvas. It uses the coordinates of the finger to draw lines or erase areas on the canvas, depending on the selected tool and mode. The drawing is updated in real-time to reflect the user's hand movements.

Implementation Details

1. **Initialization and Video Capture**: The system initializes the video capture device and sets the resolution to ensure a clear and stable video feed. The webcam captures the live video, which is then processed frame by frame.

2. **Hand Detection with MediaPipe**: MediaPipe's hand tracking model is initialized and used to process each frame of the video feed. The model detects hands and identifies 21 landmarks on each hand, providing precise coordinates for the fingertips, joints, and palm.

3. **Gesture Recognition and Mode Switching**: The system analyzes the positions of the hand landmarks to recognize gestures. When two fingers (index and middle) are up, the system enters selection mode, allowing users to choose drawing tools and colors. When only the index finger is up, the system enters drawing mode, enabling users to draw on the canvas.

4. **Drawing and Erasing**: In drawing mode, the system draws lines on the virtual canvas following the movement of the index finger. The thickness and color of the lines are determined by the selected tool. In eraser mode, the system erases the specified areas by drawing over them with a thicker brush.

5. **Overlay Management**: The system displays overlays for tool selection, allowing users to switch between different brushes and the eraser. The overlays are interactive and respond to the user's hand movements, providing a visual interface for selecting tools.

6. **Real-Time Performance**: The entire process, from video capture to hand detection, gesture recognition, and drawing execution, is optimized for real-time performance. The system operates with minimal latency, ensuring a smooth and responsive user experience.

Conclusion of implementation :

The implementation of CanvasCraft demonstrates the integration of advanced AI and computer vision technologies to create an intuitive and efficient virtual whiteboard. By leveraging MediaPipe for hand detection and OpenCV for image processing, CanvasCraft offers a touchless and natural drawing experience. The structured process flow and key functions ensure seamless interaction, making CanvasCraft a versatile tool for various applications, including education, corporate meetings, and creative industries.

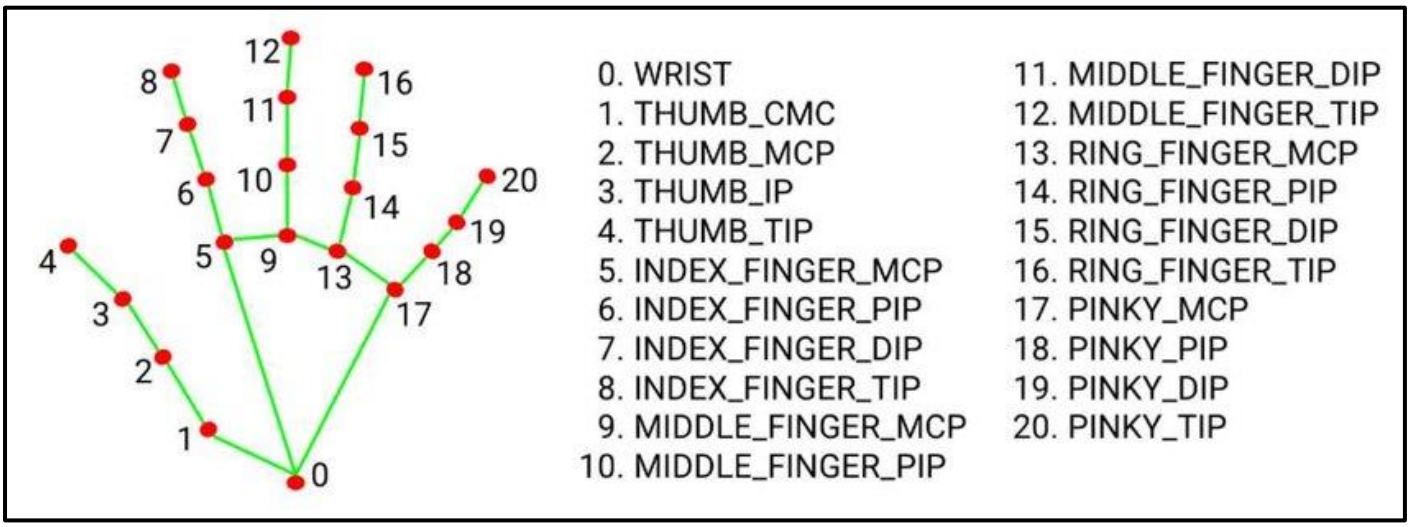

Fig 3.2 : Source – MediaPipe Website

Chapter 4: ADVANTAGES AND DISADVANTAGES

4.1 Advantages

1. Touchless Interaction: Provides a hygienic alternative to touch-based interfaces, especially useful in shared environments.
2. Intuitive User Experience: Mimics natural hand movements, making it easy for users to adapt and use without extensive training.
3. Versatility: Can be used in various settings, including education, corporate meetings, and creative industries.
4. Real-Time Performance: Ensures a smooth and responsive experience with minimal latency.
5. Accessibility: Enables individuals with physical disabilities to interact with digital content using hand gestures.

4.2 Disadvantages

1. Hardware Dependency: Requires a webca4m and sufficient computational power to process hand detection and gesture recognition in real-time.
2. Environment Sensitivity: Performance can be affected by lighting conditions and background clutter, which may interfere with hand detection.
3. Learning Curve: Some users might find it challenging to master the gestures initially, especially if they are used to traditional input devices.
4. Accuracy Limitations: While MediaPipe is robust, there might be occasional inaccuracies in hand detection and gesture interpretation.
5. Limited Gesture Set: Currently supports a limited set of gestures, which may need expansion to accommodate more complex interactions.

Chapter 5: CONCLUSION AND FUTURE SCOPE

5.1 Conclusion

CanvasCraft has demonstrated significant potential in revolutionizing digital whiteboard interactions through the use of AI and computer vision technologies. The project successfully integrates hand gesture recognition to create a virtual drawing environment, providing a seamless and intuitive user experience. By leveraging the capabilities of the MediaPipe library for hand tracking and OpenCV for image processing, CanvasCraft allows users to control a digital canvas using natural hand movements, thereby eliminating the need for traditional input devices.

The core objectives of the project were met effectively. CanvasCraft offers a robust hand detection mechanism, an intuitive drawing interface, and real-time performance, all of which contribute to a user-friendly and efficient system. The versatility of CanvasCraft makes it applicable in various settings such as education, corporate meetings, and creative industries, where it can enhance engagement, collaboration, and productivity**.**

The touchless interaction model provided by CanvasCraft addresses contemporary needs for hygienic and accessible interfaces, especially important in shared and public environments. Additionally, the project sets a foundation for future advancements in gesture-based computing, showcasing how AI-driven interfaces can transform traditional methods of interaction.

5.2 Future Scope

While CanvasCraft has achieved its initial goals, there is ample opportunity for further development and enhancement. The future scope of CanvasCraft can be expanded in several key areas:

1. Advanced Gesture Recognition: Future iterations of CanvasCraft can incorporate more complex and varied gestures. This can include gestures for undoing and redoing actions, zooming in and out, and panning across the canvas. Advanced gesture recognition will increase the functionality and flexibility of the virtual whiteboard, making it more powerful and versatile.

2. Shape Drawing Tools: Adding tools that allow users to draw predefined shapes such as circles, rectangles, arrows, and lines can significantly enhance the drawing capabilities of CanvasCraft. These

tools would be particularly useful in educational and professional settings where diagrams and structured illustrations are often required.

3. Save and Load Functionality: Implementing features that allow users to save their drawings and load previous sessions will make CanvasCraft more practical for long-term projects. Users can continue their work over multiple sessions and maintain a digital archive of their drawings and annotations.

4. Multi-User Support: Enabling the system to support multiple users simultaneously can foster collaborative work environments. This would be beneficial in classrooms, meetings, and brainstorming sessions where multiple participants can interact with the digital canvas in real-time.

5. Enhanced Customization Options: Providing users with more options to customize their drawing experience, such as a wider range of brush sizes, colors, and styles, as well as personalized user interfaces, can improve user satisfaction and adaptability.

6. Integration with Other Tools: CanvasCraft can be integrated with other digital tools and platforms such as virtual meeting software, educational platforms, and design tools. This integration would expand its usability and make it a more comprehensive solution for various professional and creative needs.

7. Improved Accuracy and Robustness: Continued refinement of the hand detection and gesture recognition algorithms can enhance the accuracy and robustness of the system. Addressing issues related to varying lighting conditions, background clutter, and occlusions will make CanvasCraft more reliable and user-friendly.

8. Cross-Platform Compatibility: Expanding CanvasCraft's compatibility across different operating systems and devices, including tablets and smartphones, can make it more accessible to a broader audience. This would allow users to utilize CanvasCraft on their preferred devices, increasing its flexibility and convenience.

CanvasCraft is a pioneering step in the realm of AI-powered virtual whiteboards, offering a glimpse into the future of touchless and gesture-based interactions. The successful implementation of real-time hand gesture recognition and a dynamic drawing interface highlights the potential of combining AI and computer vision technologies. With ongoing advancements and expansions, CanvasCraft has the potential to become an indispensable tool in education, business, and creative fields, driving forward the innovation in digital interaction and collaboration.
